

Juicetification: Forecast Frenzy

Your quick-start guide to the campus juice-bar forecasting lab — about 60 minutes, worked left to right

~60 min · work left → right

1

Start Here

meet the bar

2

Learn 9 Methods

naïve → regression

3

Run Juicetification

forecast → plan → open

4

Debrief

what did you learn?

Submit PDF

to your LMS

HOW EVERY MODULE WORKS

- 1 **Read the objective & the formula** — what you're learning and the math behind it.
- 2 **Apply it — your choice** — compute it yourself, estimate then reveal, or show the answer.
- 3 **Write the Excel formula** — the app runs it on the grid and checks your answer.
- 4 **Read the feedback** — is your answer reasonable, and what's even better?
- 5 **Answer the guiding question & try again** — then a green check points you to the next tab.

Running Juicetification: pick your forecast → **calculate** the staffing & prep plan yourself → set the sliders and **open for the day**. You'll see profit, satisfaction, and where over- or under-forecasting cost you money.

In Excel, always use cell references.

Point to the cells (`=AVERAGE(D5:F5)`), never type the numbers (`=(280+300+315)/3` is rejected). That's the skill employers want.

YOUR THREE SCORES

/100

COMPLETENESS

effort — how much you finished

/100

MASTERY

skill — right on the first try

/100

PERFORMANCE

application — how you ran the bar

WATCH YOUR PROGRESS

The sidebar shows a live progress bar and your mastery so far. Answers save automatically — go back and edit any tab before you submit.

WHAT TO SUBMIT

- Add your **name / student ID** in the sidebar.
- Finish all sections (aim for **Completeness 100**).
- On **Final Report**, download the **Submission PDF**.
- Upload the PDF to your LMS.

The debrief matters most. It shows your biggest forecast miss and what it cost — then asks for one rule you'll keep. That rule is the real takeaway.

Your data is unique. Everyone gets a different scenario — compare methods, not answers.

Stuck on a number? Pick "Estimate, then reveal" for the worked solution, then try the Excel version.

Mind the trade-off. Under-forecasting loses sales & goodwill; over-forecasting spoils fruit.
